

Great Migrations

Support Statetment: ReplaceFile for AppObject

With BuildFile= local in the translation Script (**note lang must be csproj or vbproj**)

```
<Output Status="New" Filename="%BndPath%" />

<Author>

<Fix name="PostEdit_ReplaceFiles" host="">
  <ReplaceFile lang="csproj" <---
    name="remove AppObjects"
    source="%NetProjFolder%\%SrcName%_AppObject.cs"
    target="..\usr\handcode\%SrcName%_AppObject.cs"
  />
</Fix>
```

Note: AppObjects files are used to provide a Singleton for an instance classes that exposes "Global" members in some VB6/COM APIs.
