gmplSurfacePatternStatement

:page_with_curl: SurfacePattern Statement Summary

SurfacePattern is a terminal, refactoring statement that occurs only within a **Refactor** statement. It sets the surface pattern authored for an operation. The setting applies to the current target dialect.

The attributes of the **SurfacePattern** statement are as follows:

Attribute	Description
opc	This required identifier attributes specifies the opcode and subcode that identifies the operation to be modified. If the opcode or subcode is not found, the statement is ignored.
narg	This optional numeric value specifying the number of parameters that are expected in the pattern string. The parameter values are pulled from the string stack associated with the current instance of the operation.
status	An optional keyword describing the overall status of the operation authored via the surface pattern strings: Ok , Delete , Deprecated , NotImplemented , MustCorrect , NotIdent , Postfix , or NeedsPren . The default is Ok .
code	The pattern string to be used in authoring the operation.

:bulb: Example

The following example shows how to use the SurfacePattern statement to alter how On Error Resume Next (OERN) is expressed in translations. In the default translation for OERN, the translator evaluates the code context of the OERN, and if appropriate, it rewrites the protected block of statements as a call to helper method,

gmRTL.Core.ErrorHandling.ResumeNext. The syntax for authoring this call block is expressed with two special surface patterns: one to open the block and one to close the block. This syntax is associated with the IFS opcode that is specified in the VBASIC.XML metalanguage file as follows:

```
<pattern id="IFS">
  ...
  <subcode id="OpenResumeNext">
    <csn role="command" narg="0"
code="gmRTL.Core.ErrorHandling.ResumeNext(() =>\n{\p"/>
    <vbn role="command" narg="0"
code="gmRTL.Core.ErrorHandling.ResumeNext(Sub())\p"/>
  </subcode>
  <subcode id="CloseResumeNext">
    <csn role="command" narg="0" code="\q});\n"/>
    <vbn role="command" narg="0" code="\qEnd Sub)\n"/>
  </subcode>
```

Although we start most projects with the default translation using gmRTL.Core.ErrorHandling.ResumeNext, we will usually recommend reworking the use of OERN. For example, we will change the translation to simply report comments at the beginning and ending of the protected block. The SurfacePattern commands below replace the IFS.OpenResumeNext and IFS.CloseResumeNext syntax with these comments. In this case, the opcode.subcode operations' syntax are overridden by adding Refactor/SurfacePattern rules to the Compile command in the translation script.

```

...
<Compile>
  <Refactor>
    <SurfacePattern opc="IFS.OpenResumeNext"
      narg="0"
      code="// UPGRADE_INFO: START OERN\c"/>
    <SurfacePattern opc="IFS.CloseResumeNext"
      narg="0"
      code="// UPGRADE_INFO: END OERN\c"/>
  </Refactor>
</Compile>
...

```

The effect of these SurfacePattern rules is to alter how the OERN operations are authored in generated code as shown below.

<pre> 21733private void tbToolBar_ButtonClick(object sender, ToolStr 21734{ 21735 System.Windows.Forms.ToolStripItem Button; 21736 Button = (System.Windows.Forms.ToolStripItem)e.Clicked; 21737 bool success = false; 21738 gmRTL.Core.ErrorHandling.ResumeNext(); 21739 { 21740 switch(Button.Name) 21741 { 21742 case "Open": 21743 mnuFileOpen_Click(null, new EventArgs()); 21899 frmOperatorMeasurement.DefInstance.Show(); 21900 frmOperatorMeasurement.DefInstance.WindowSt 21901 break; 21902 } 21903 } 21904 } </pre>	<pre> 21737private void tbToolBar_ButtonClick(object sender, ToolStr 21738{ 21739 System.Windows.Forms.ToolStripItem Button; 21740 Button = (System.Windows.Forms.ToolStripItem)e.Clicked; 21741 bool success = false; 21742 // UPGRADE_INFO: START OERN; 21743 { 21744 switch(Button.Name) 21745 { 21746 case "Open": 21747 mnuFileOpen_Click(null, new EventArgs()); 21902 frmOperatorMeasurement.DefInstance.Show(); 21903 frmOperatorMeasurement.DefInstance.WindowState = Sy 21904 break; 21905 } 21906 } 21907 } </pre>
